

I used Chrome, Safari, and Firefox to test how the different browsers rendered my website. Upon close look, colors, fonts, links and spacing between the different elements seem to look quite identical. Using the CSS reset code most likely helped with ensuring the pages were very similar between the three browsers. There were, however, a couple of minor discrepancies I caught on both Safari and Firefox. In Safari, the radio buttons did not show the shadow when they were clicked. In Firefox, the page rendered with empty space between the main page and the background in the body. Overall, I believe the slight differences were negligible and does not affect user experience.
